Question 5

1) Create a testcase for exploratory testing
2) Track the progress of the specific release or sprint
3) Demonstrate how to handle re-execution of failed test in xray

First, create an issue in Jira for Login Page Testing. Select the issue type as Story or Task and add it to the sprint.

Next, create two test cases. One test case is for valid login where correct email and password are entered and login should be successful. The second test case is for invalid login where wrong credentials are entered and an error message should be displayed.

After that, create a test plan and add both test cases to the test plan.

Then, create a test execution (test run) in adhoc mode and include both test cases in it.

Execute the test cases. The valid login test case should pass and the invalid login test case should fail.

Now, apply a filter to show only failed test cases using status equals failed. This will display only the failed test case.

Re-execute the failed test case after fixing the issue if required, and update the result as pass or fail.

To track sprint progress, open the sprint board and check completed and in-progress tasks. Use sprint reports and burndown charts to monitor progress.

Finally, add screenshots of test cases, test execution results, failed test case filter, and re-execution as part of the documentation.

Sprint Report

How to read this chart

How to read this chart

Understand the work completed or pushed back to the backlog in each sprint. This helps you determine if your team is overcommitting or if there is excessive scope creep.
